

# Integrating Bird Strike Risk and Avian Survey Data to Prioritize Management Goals

*Brad Blackwell*

*Travis DeVault*

*Thomas Seamans*

***“No management decision is possible  
until we know what it is we want.”***

*Graeme Caughley. Analysis of Vertebrate  
Populations*

# Purpose

- Enter into a dialogue on following question:

How can we best utilize avian survey data to *inform* our estimates of strike risk?

# Approach

- Strike risk
- Airport wildlife surveys
- Developing airport-specific strike risk estimates
- Prioritizing management
- Evaluation

# Strike Risk

Requirements to estimate strike risk?

- Annex 14, Volume 1, *Aerodrome Design and Operations*, ICAO (2004) introduced the requirement of Safety Management Systems (SMS) for airports in member states, a program in which risk assessment is emphasized.

- Wildlife Hazard Management Plan...to proactively monitor wildlife hazards, analyze trends, and to understand and anticipate fluctuations in risk.

*Dolbeer, R. A., S. E. Wright, J. Weller, A. L. Anderson, and M. J. Begier. 2016. Wildlife strikes to civil aircraft in the United States 1990-2015. ■*

*U.S. Department of Transportation, Federal Aviation Administration, Office of Airport Safety and Standards,*

*Serial Report 22, Washington, D.C., USA.*

- What is risk?
  - Likelihood.
    - » sources of a problem,
    - » potential endpoints (e.g., hull loss)
    - » how sources contribute to those endpoints.

- Application to managing wildlife populations on airports?
  - Seasonality, habitats, diurnal patterns of use, numbers, strike frequency, & direct/indirect damage

- What is a strike hazard score?
  - Likelihood of aircraft damage or effect on flight when strikes occur.
  - Informs us of the likelihood of damage if a certain species is struck.
  - Does not inform us of the likelihood of the strike and subsequent damage.

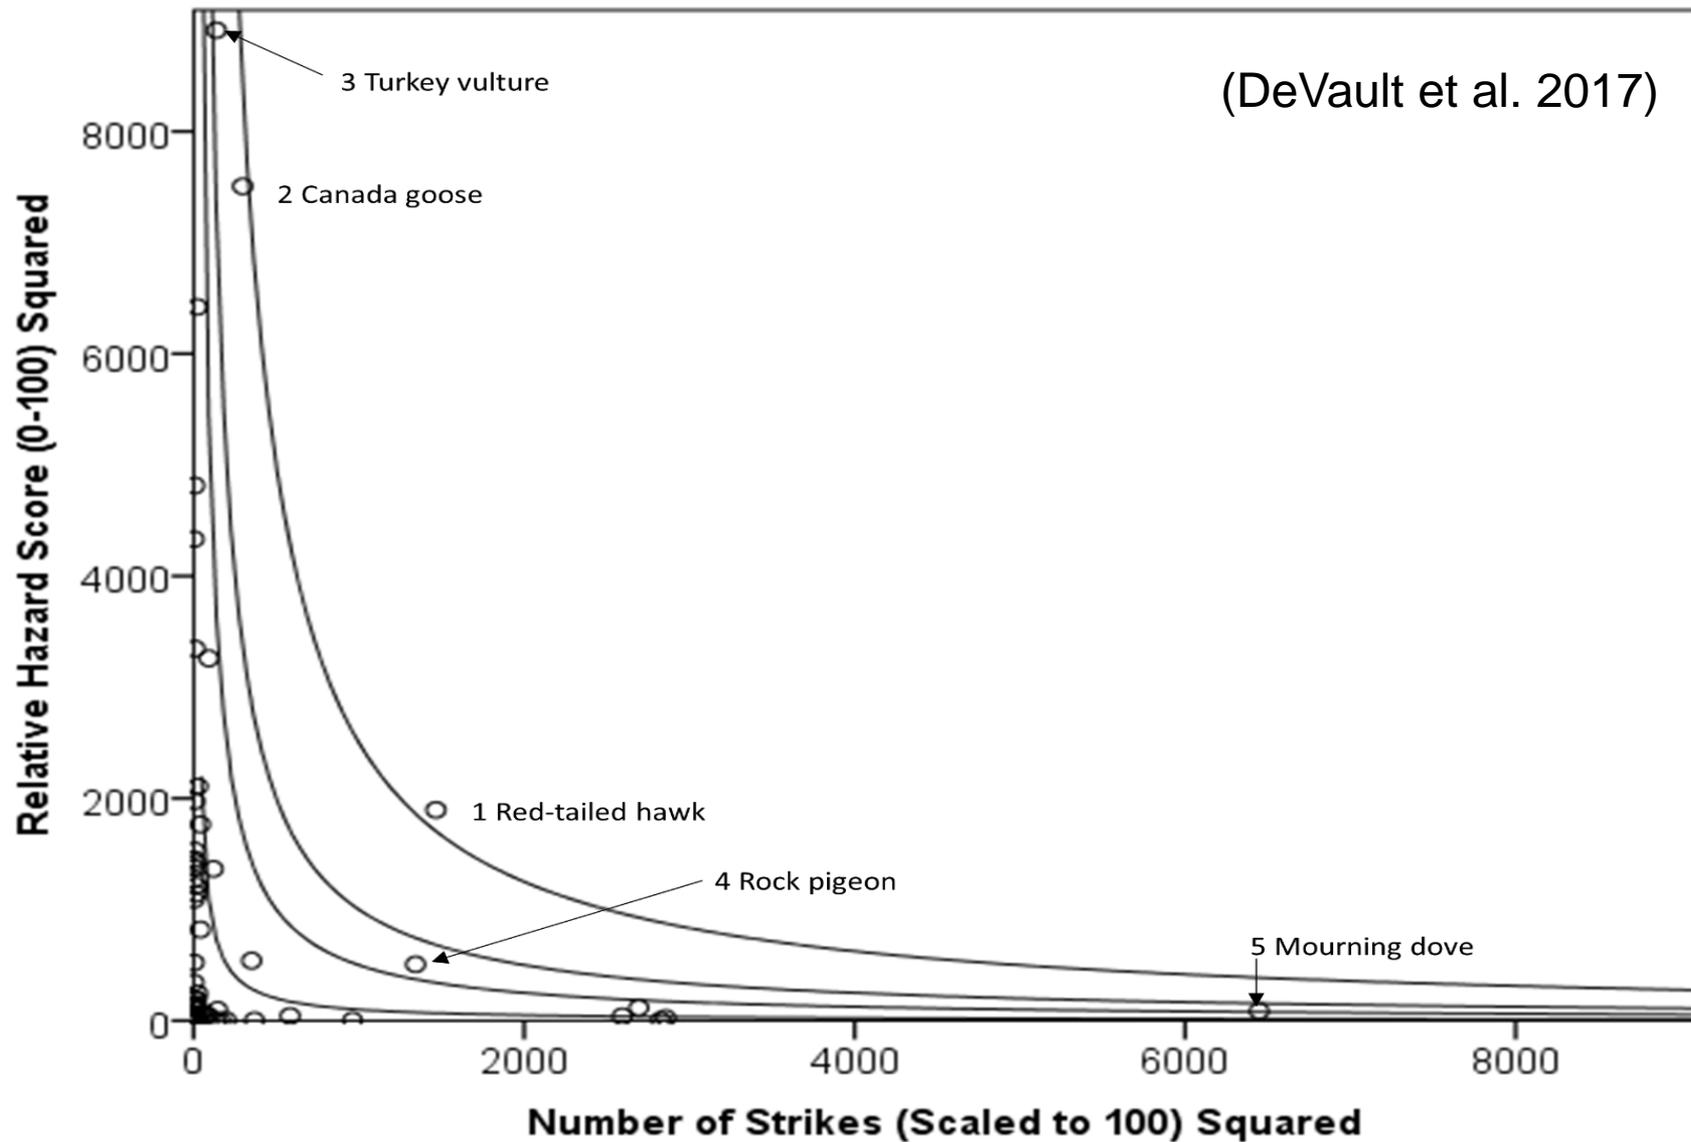

- What is strike risk?
  - Likelihood, which can be applied to proactively direct management to mitigate immediate and future wildlife threats to aviation safety.
  - (frequency component) x (severity component)

(frequency component) x (severity component)

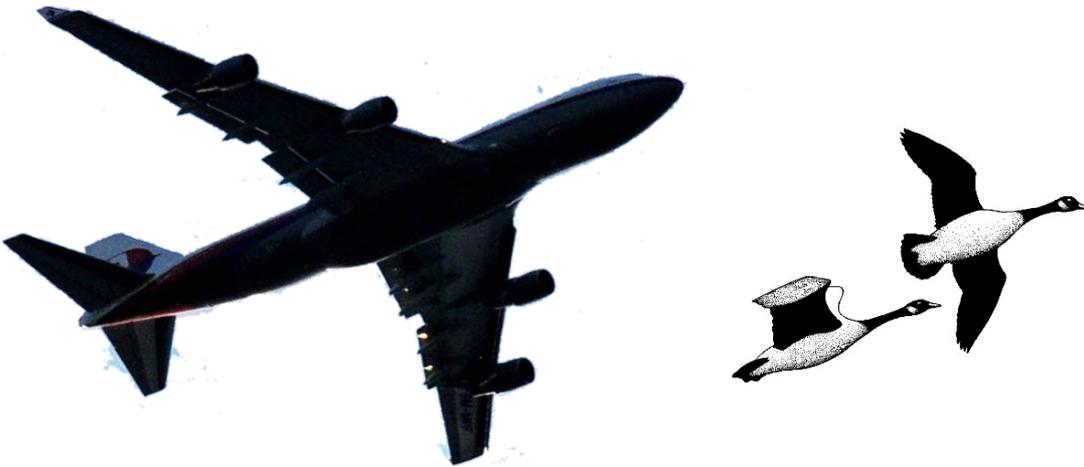

(species-specific strikes) x (species hazard score)

| Species           | Risk rank | Damaging strikes | Total strikes | RHS | Risk      | Total reported cost (\$US) |
|-------------------|-----------|------------------|---------------|-----|-----------|----------------------------|
| Red-tailed hawk   | 1         | 118              | 515           | 44  | 2,780,325 | 17,660,362                 |
| Canada goose      | 2         | 121              | 232           | 87  | 2,233,249 | 10,872,559                 |
| Turkey vulture    | 3         | 89               | 158           | 94  | 1,229,499 | 4,444,706                  |
| Rock pigeon       | 4         | 40               | 493           | 23  | 680,923   | 3,982,209                  |
| Mourning dove     | 5         | 36               | 1,080         | 9   | 560,248   | 569,698                    |
| European starling | 6         | 28               | 698           | 11  | 315,575   | 697,385                    |
| Mallard           | 7         | 34               | 129           | 57  | 299,799   | 5,617,599                  |
| Ring-billed gull  | 8         | 28               | 252           | 23  | 189,512   | 537,910                    |
| Herring gull      | 9         | 26               | 147           | 37  | 163,056   | 2,011,880                  |
| Bald eagle        | 10        | 28               | 64            | 80  | 145,365   | 8,693,343                  |

(DeVault et al. 2017)

# Factors contributing to strike risk:

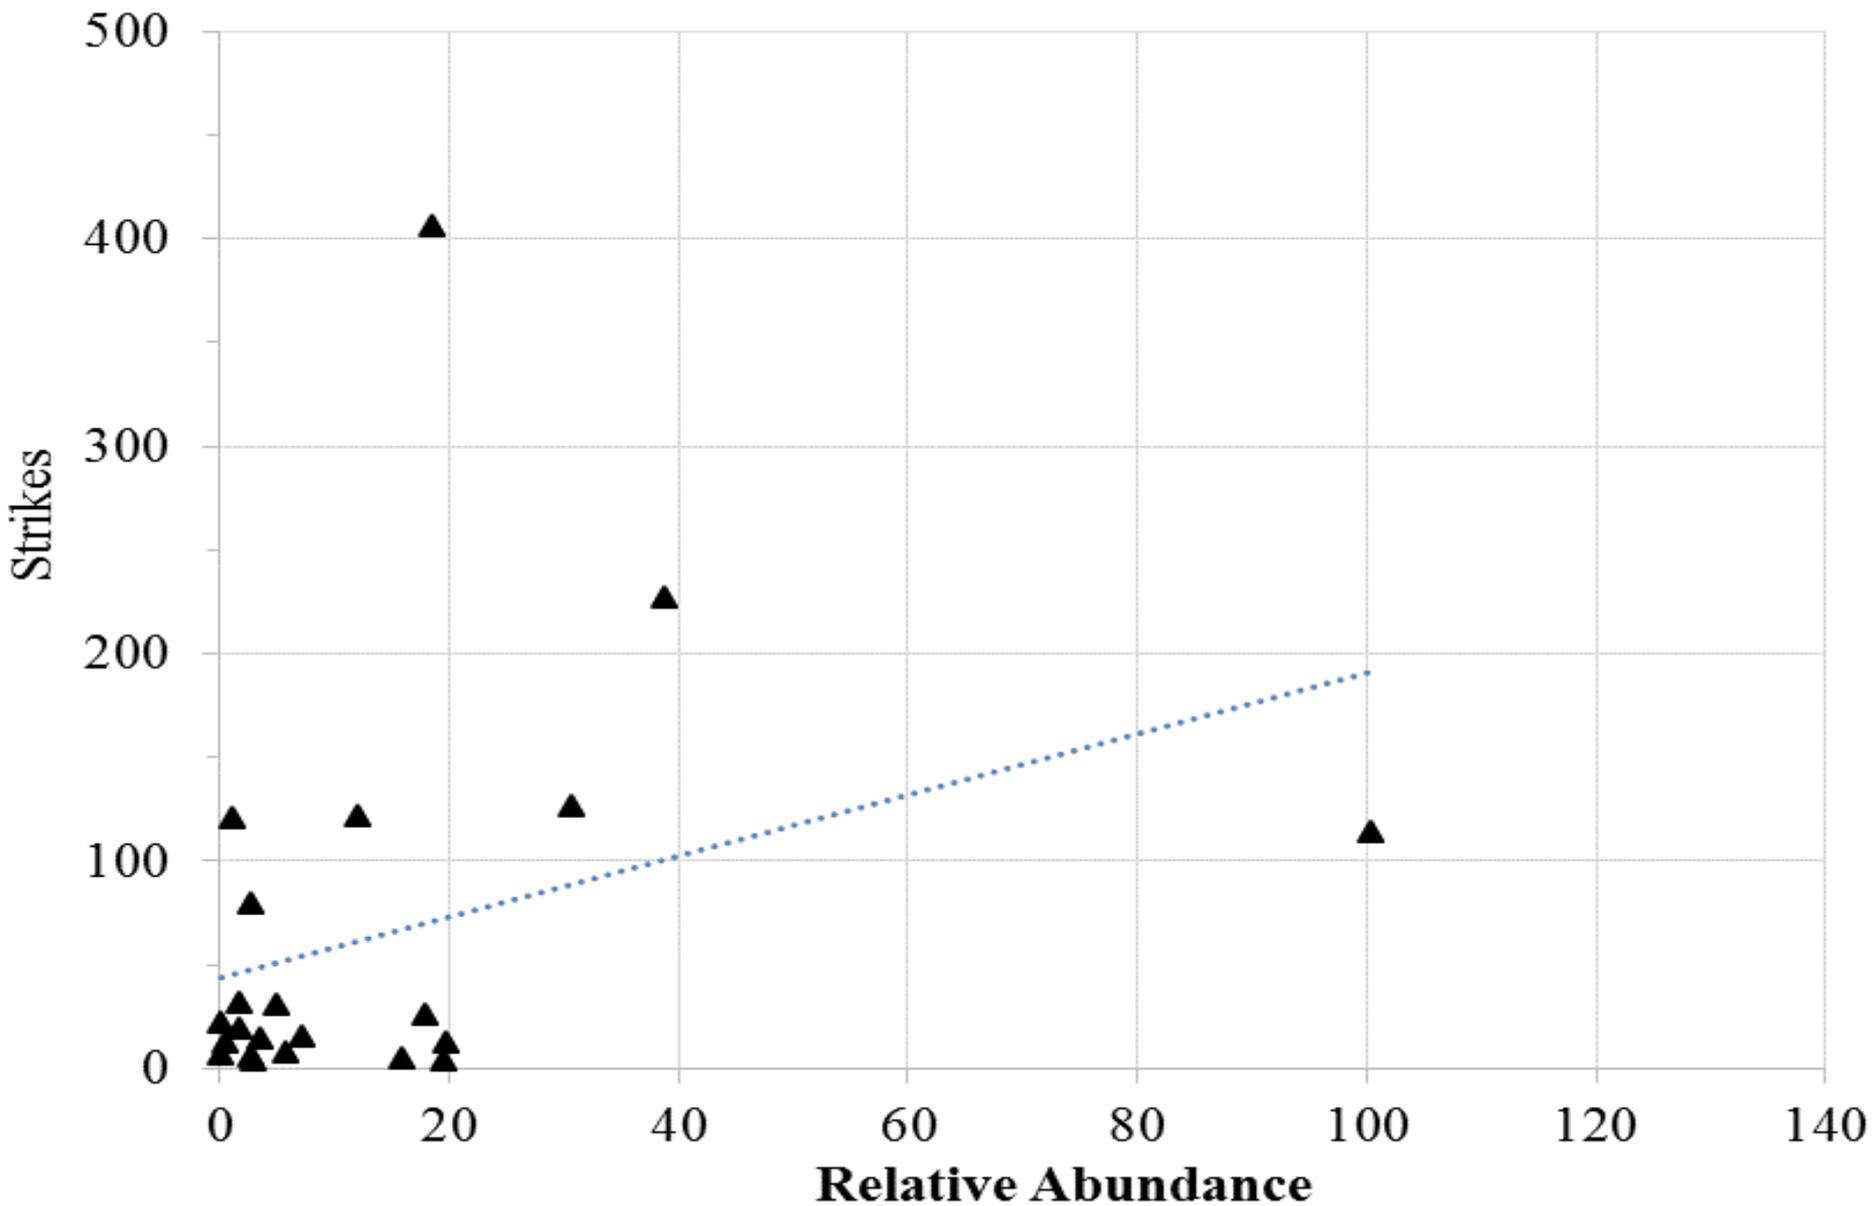

1. Aircraft type
2. Phase of flight
3. Aircraft movements
4. Relative position of birds in space and time
5. Relative frequency of species strikes
6. Species & associated hazard

## Factors contributing to strike risk:

1. Aircraft type
2. Phase of flight
3. Aircraft movements
4. Relative position of birds in space and time
5. Relative frequency of species strikes
6. Species & associated hazard

## – Requirement

In conducting a Wildlife Hazard Assessment 14 CFR Part 139.337 (c)(2) requires the *“identification of the wildlife species observed and their numbers, locations, local movements, and daily and seasonal occurrences.”*

Wildlife Hazard Management Plan: 14 CFR 139.337 (f)

- rationale:

Accurate survey data support and guide management actions.

- objective:

To identify and quantify wildlife hazards on and near airport properties.

# How do we adapt the strike risk concept to a specific airport?

- Is species strike risk equal across airports where a particular species is observed?
- What is the strike risk for a species that uses an airport habitat(s), but has never been struck?

- If management priorities will be based on risk, does strike risk that is estimated based on broad data from the FAA strike database apply to your airport?
- If not, how is strike risk estimated for a species observed, but not struck?

- Developing airport-specific strike risk estimates
  - Example airport

# Strike Risk:

$(\text{strikes scaled to } 100)^2 \times (\text{RHS scaled to } 100)^2$

| Species observed on the airport | Overall Strike Risk (FAA & DeVault et al. 2017) | Rank |
|---------------------------------|---|------|
| Red-tailed hawk                 | 2780325   | 1    |
| Canada goose                    | 2233249   | 2    |
| Turkey vulture                  | 1229499   | 3    |
| Rock pigeon                     | 680923  | 4    |
| Mourning dove                   | 560248  | 5    |
| European starling               | 315575  | 6    |
| Mallard                         | 299799  | 7    |

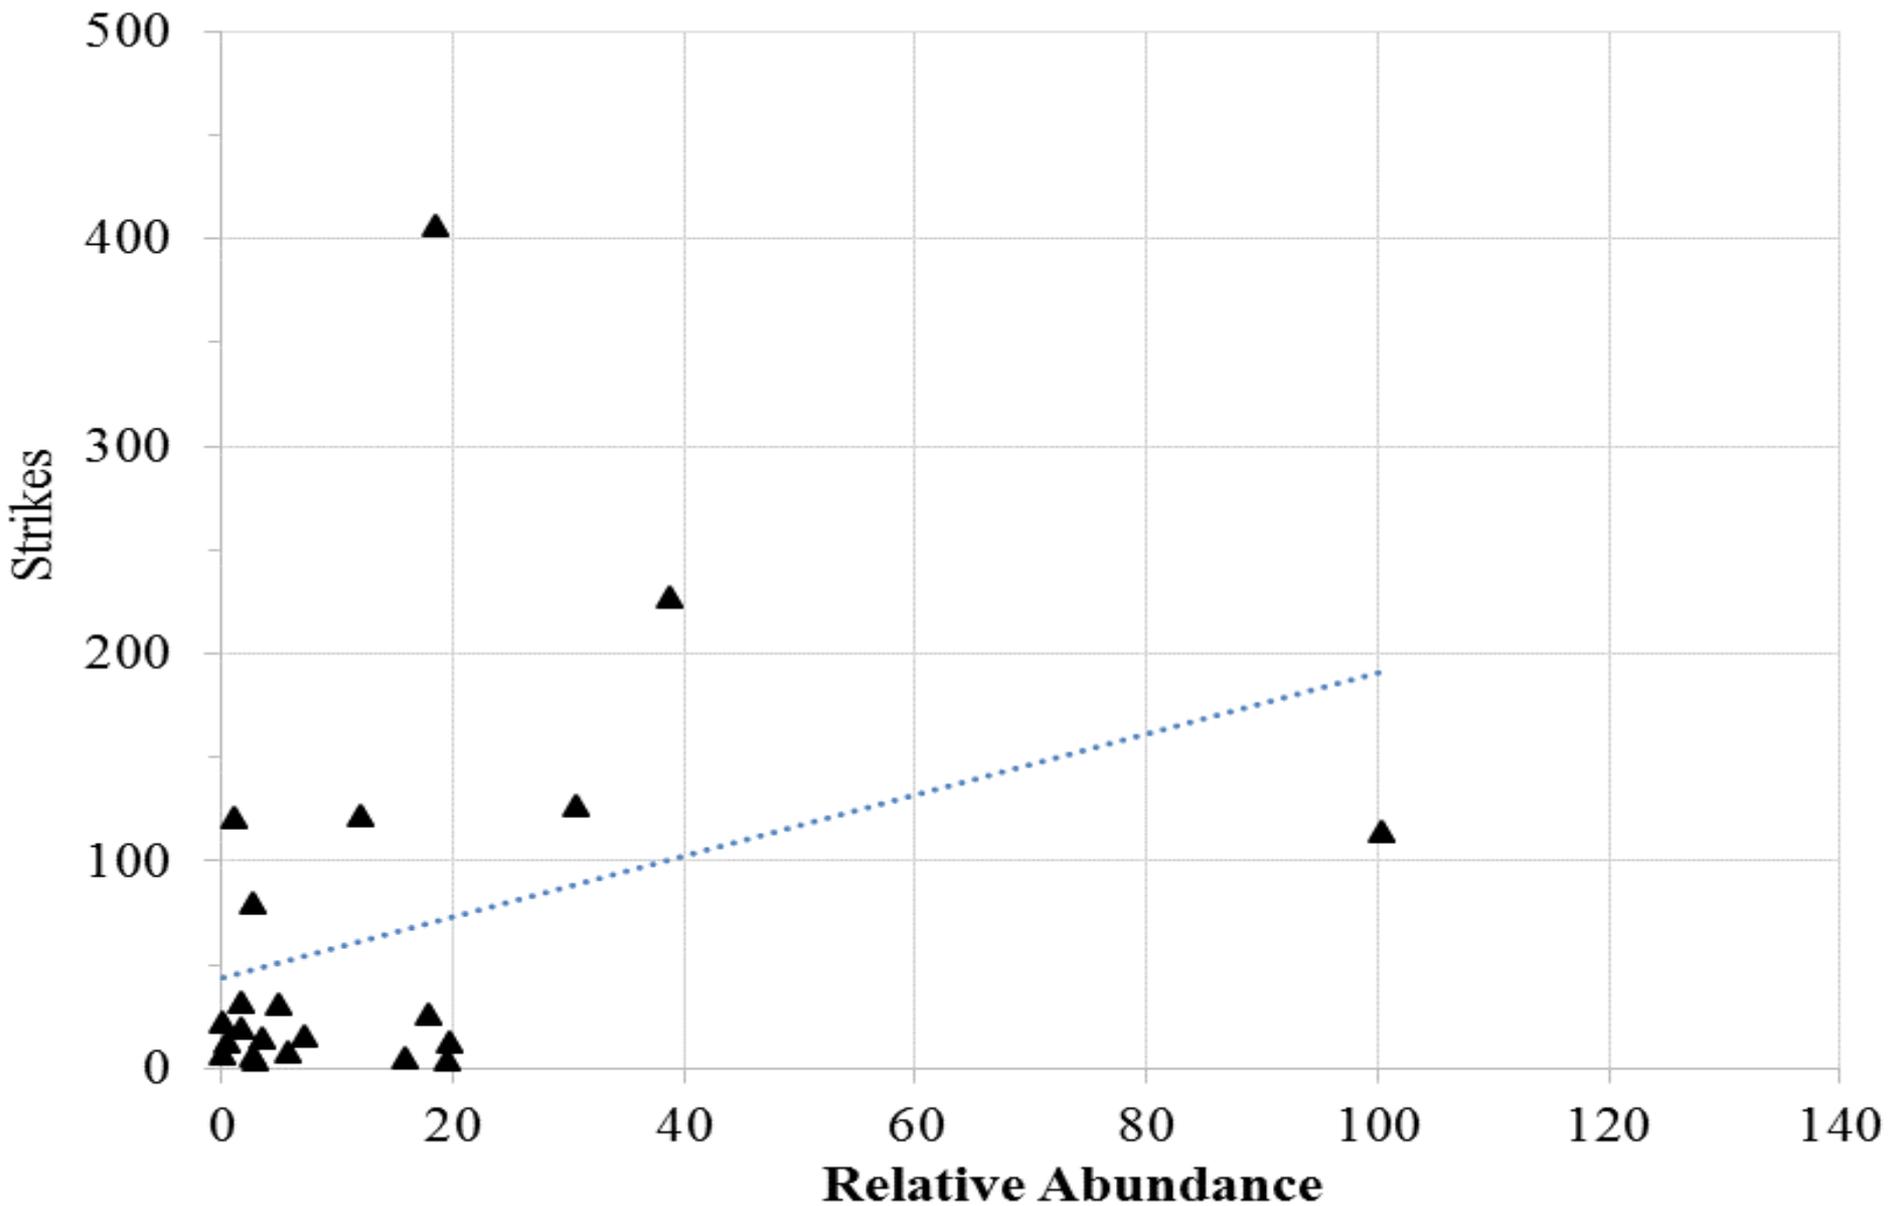

| Species observed on the airport | Overall Strike Risk (FAA & DeVault et al. 2017) | Rank |
|---------------------------------|---|------|
| Red-tailed hawk                 | 2780325   | 1    |
| Canada goose                    | 2233249   | 2    |
| Turkey vulture                  | 1229499   | 3    |
| Rock pigeon                     | 680923  | 4    |
| Mourning dove                   | 560248  | 5    |
| European starling               | 315575  | 6    |
| Mallard                         | 299799  | 7    |

- Risk for species not struck?
- Is risk based on across-airport reports (FAA strike database) applicable to your airport?

# Airport Strike Risk:

$$(\text{strikes scaled to } 100)^2 \times (\text{RHS scaled to } 100)^2$$

For species not struck, the frequency component must be replaced. We have the RHS.

| Species           | Airport Strike Risk | Survey RA (individuals) | Prop. RA | Prop. time in critical airspace (RPZ, runway/taxi) |
|-------------------|---------------------|-------------------------|----------|--|
| Turkey vulture    | 45081632.7          | 0.66                    | 0.007    | 0.900  |
| Red-tailed hawk   | 1011461.2           | 0.66                    | 0.007    | 0.900  |
| European starling | 888979.6            | 65.70                   | 0.666    | 0.500  |
| Mourning dove     | 5290000.0           | 3.94                    | 0.040    | 0.100  |
| Canada goose      | 0.0                 | 6.60                    | 0.067    | 0.100  |
| Mallard           | 0.0                 | 13.14                   | 0.133    | 0.100  |
| Rock pigeon       | 0.0                 | 7.88                    | 0.080    | 0.900  |

# Species Relative Frequency, SRF

$$\text{SRF} = (\text{Prop. RA}) \times (\text{Prop. Time critical airspace})$$

SRF is then scale to 100

| Species           | Airport Strike Risk | Species Relative Frequency |
|-------------------|---------------------|----------------------------|
| Turkey vulture    | 45081632.7          | 2                          |
| Red-tailed hawk   | 1011461.2           | 2                          |
| European starling | 888979.6            | 100                        |
| Mourning dove     | 5290000.0           | 1                          |
| Canada goose      | 0.0                 | 2                          |
| Mallard           | 0.0                 | 4                          |
| Rock pigeon       | 0.0                 | 22                         |

# Airport Strike Risk:

$(\text{strikes scaled to 100})^2 \times (\text{RHS scaled to 100})^2$

| Species      | Species Relative Frequency<br>(Prop. RA x Prop. Time) | RHS | Airport<br>Strike Risk |
|--------------|---|-----|------------------------|
| Canada goose | 2   | 87  | 30276.0                |
| Mallard      | 4   | 57  | 5198.4                 |
| Rock pigeon  | 22  | 23  | 256036.0               |

| Species           | Airport Strike Risk | Rank |
|-------------------|---------------------|------|
| Turkey vulture    | 45081632.7          | 1    |
| Red-tailed hawk   | 1011461.2           | 3    |
| European starling | 888979.6            | 4    |
| Mourning dove     | 5290000.0           | 2    |
| Canada goose      | 30276.0             | 6    |
| Mallard           | 5198.4              | 7    |
| Rock pigeon       | 256036.0            | 5    |

## ■ Prioritizing management

- |                   |   |
|-------------------|---|
| Turkey vulture    | 1 |
| Mourning dove     | 2 |
| Red-tailed hawk   | 3 |
| European starling | 4 |
| Rock pigeon       | 5 |
| Canada goose      | 6 |
| Mallard           | 7 |

## ■ Evaluation

– Do this annually

- Species struck
- Calculate strike risk, then rank
- Compare to previous strike risk ranks
- Assess your management
- New priorities
